

Personal Introduction (60–90 seconds)

My name is David.

I have a background in software development, machine learning and industrial engineering.

Recently, I have been focusing on machine learning projects built from scratch using Python and libraries such as NumPy and Pandas. These projects involve data preprocessing, feature engineering, model training and evaluation.

My most recent project is a neural network that predicts whether a breast tumor is benign or malignant based on several physical characteristics. The goal of the project was not only to build a working model but also to understand how neural networks work internally by implementing many of the core concepts myself.

I developed my software engineering skills at 42 Málaga, where I learned fundamental computer science concepts using C and C++, worked on a full-stack team project and developed collaboration and communication skills by working in teams of two to five people.

Currently, I am expanding my knowledge in Data Engineering and MLOps, and I am looking for opportunities where I can continue growing while contributing to real-world projects.

Why are you interested in this role?

I am interested in roles that combine data, software engineering and AI technologies.

What attracted me to this opportunity is the chance to work with modern data platforms such as Snowflake and AI-related technologies like Cortex AI. I enjoy learning new technologies and applying them to solve real business problems.

I also like the way your company works with innovation, from validating ideas and building MVPs to delivering solutions for international clients.

Another aspect that caught my attention is your focus on employee development. I am an ambitious and motivated person, and I am looking for a company where I can learn from experienced professionals while contributing my own skills and enthusiasm.

Strengths / Why Should We Hire You?

My main strength is my ability to learn quickly and adapt to new technologies.

I have a solid technical foundation in software engineering, particularly in C, C++ and Python, as well as experience with tools such as Git and Docker.

I enjoy solving complex problems and working on challenging projects. When I face something I don't know, I am usually very proactive about learning it and finding solutions.

I also enjoy collaborating with other people. Throughout my projects, I have worked in teams and learned how to communicate effectively, share responsibilities and solve problems together.

I believe you should hire me because I bring strong technical foundations, a high level of motivation and a genuine desire to grow. While there are technologies in this role that I am still learning, I have consistently demonstrated that I can learn quickly and become productive in new areas.

Salary discussion

It would depend on the type of contract, the responsibilities and the overall compensation package. I am very interested in the opportunity, so I would first like to learn more about the role. However, I am open to discussing a salary that is aligned with the market and the responsibilities of the position.

What experience do you have with Snowflake?

I haven't worked with Snowflake professionally yet, but i have been studying its architecture and ecosystems. My strongest areas are Python and machine learning, and i am currently expanding my knowledge in Data Engineering technologies.

What are your weaknesses?

One are i am currently developing is my experience with some enterprise data technologies such as Snowflake and DBT. However, I have already started learning them because i am really interested in this field.

Where do you see yourself in 3-5 years?

I would like to become a strong Data Engineer or AI Engineer with expertise in cloud technologies, data platforms and machine learning systems.

Do you have any questions for us?

What would success look like in the first three months? What kind of problems would I be working on, and what would my day-to-day responsibilities look like? What does the team structure look like? How many people are involved in the project? Which technologies are used most heavily on a daily basis? What type of contract is being offered? Is the initial duration still three months, and is there a possibility of extension afterward? What language is primarily used within the team and with clients? What would

my first month look like if I joined the team? How looks like my first employment month? What are the usual working hours for the team? Based on the process described on your website, do you have an estimate of the timeline for the next stages?
